Install VersePoint on macOS

The universal app supports Intel and Apple silicon Macs. This build is unsigned and is not notarized by Apple.

1. Extract the download bundle

Download **VersePoint-macOS-universal-1.1.0.zip** from the official VersePoint release. Double-click the ZIP to extract it.

Inside are **VersePoint-1.1.0-mac-universal.dmg**, this macOS Installation Guide and the Operator Workflow PDF. Keep both guides for reference.

2. Open the DMG and install

Double-click the DMG. In its window, drag **VersePoint.app** into **Applications**. Wait for the copy to finish, then eject the mounted disk image.

Launch the copy in Applications. Do not run VersePoint from the mounted installer.

The standalone DMG on the release page installs the same app. If you downloaded it directly, open it and follow the same steps.

Upgrading an existing installation

Save a dated settings backup and keep external media available. Quit VersePoint before replacing the app in Applications.

After opening the new copy, check your Songs, Programs, Motion designs and output settings. Keep the backup until your normal service workflow is verified.

Approve a trusted download

macOS may block an app without an identified developer signature. Continue only when you trust the source and intended file.

1. Try opening the installed app

In Applications, double-click **VersePoint.app**. If macOS blocks it, dismiss the warning. Confirm the file came from the official VersePoint release.

2. Open Privacy & Security

Open **Apple menu > System Settings > Privacy & Security**. Scroll down to Security and find the message for the app you just tried to open.

3. Select Open Anyway

Select **Open Anyway** for VersePoint, then confirm **Open** when macOS asks again. Authenticate if requested. Later launches normally use the saved exception.

If approval is unavailable

Try opening the installed app once more, then return to Privacy & Security. A managed Mac may require administrator approval.

Keep Mac security enabled. If the app is reported as damaged or harmful, stop and ask for support instead of overriding that alert.

Apple guidance

The steps above follow Apple's guidance for opening a trusted unsigned app: support.apple.com/en-us/102445.

Check the service setup

Installation is complete only after the app opens and your content and actual outputs work on this Mac.

Verify the app and your saved content

Open VersePoint from Applications. Confirm the intended version in About and check Songs, Programs, Media and saved designs.

If loading or saving reports an error, preserve your files and use the visible retry after correcting storage or access. Do not reset the profile to solve an installation warning.

Connect and test your outputs

Connect the projector or second display. In Settings, choose the correct **Projector Screen**, select **Screen On**, and verify the physical display.

If using Web Output in OBS, test its live URL separately. Follow the Operator Workflow for phone permissions, document pages, audio and pre-service checks.

Prepare source files

PDF files open directly. PowerPoint and Keynote conversion needs Keynote or LibreOffice on this Mac. macOS may ask permission for VersePoint to control Keynote.

Keep external media, audio, imported Bible files and custom fonts available. Settings backups do not embed those external sources.

Need help?

Use the official VersePoint support or issue page. Include your macOS version, Mac model, VersePoint version and exact warning; do not include private service content.
