VersePoint

macOS Installation Guide

A simple guide for intentionally unsigned builds

RECOMMENDED Use macOS Open Anyway first

Start here

This installation pack contains VersePoint.app and this guide. Because this build is not signed with an Apple Developer ID, macOS may ask you to approve it the first time.

1 Unzip

Open the downloaded VersePoint ZIP file.

2 Move

Drag VersePoint.app into Applications.

3 Open

Try opening VersePoint normally.

If macOS blocks VersePoint

Continue with Method 1 on the next page. Most users will not need Terminal.

METHOD 1 - RECOMMENDED

Approve VersePoint in macOS

Use Apple's built-in approval option after macOS blocks the first launch.

1

Move VersePoint into Applications

From the unzipped installation pack, drag VersePoint.app into the Applications folder.

2

Try to open VersePoint

Open Applications and double-click VersePoint.app. If macOS blocks it, close the warning.

3

Open Privacy & Security

Choose Apple menu > System Settings > Privacy & Security, then scroll down to Security.

4

Click Open Anyway

IMPORTANT

Find the message saying VersePoint was blocked, then click Open Anyway.

5

Confirm Open

When macOS asks again, click Open. Enter your Mac password if macOS requests it.

6

Launch normally next time

After this one-time approval, open VersePoint from Applications as usual.

Open Anyway is missing?

Try opening VersePoint once more, then return immediately to Privacy & Security.

METHOD 2 - FALLBACK ONLY

Remove the quarantine attribute

Use this Terminal method only if Method 1 did not work.

Before you continue

Only use this command if you downloaded VersePoint from a source you trust. It targets only VersePoint.app in your Applications folder.

1 **Check the app location**

Make sure the app is named VersePoint.app and is inside the Applications folder.

2 **Open Terminal**

Press Command + Space, type Terminal, then press Return.

3 **Copy and paste this exact command**

```
xattr -dr com.apple.quarantine /Applications/VersePoint.app
```

4 **Run the command**

Press Return. When the prompt appears again, close Terminal.

5 **Open VersePoint**

Open Applications and double-click VersePoint.app. It should now launch.

If Terminal says No such file or directory

Check that VersePoint.app is in Applications and that its name has not changed. Do not modify the command to point at an unfamiliar file.
